

# Hangman Master

# ■ Hangman Master

## Overall Project Description

Hangman Master is an interactive word-guessing game developed in Python using the Tkinter library. The objective of the game is to guess a hidden word by selecting one letter at a time before all available lives are lost.

The game randomly selects a word from a predefined list and displays blank spaces representing each letter. Players use the on-screen A–Z keyboard to make guesses. Correct guesses reveal the corresponding letters in the word, while incorrect guesses reduce the number of remaining lives and gradually draw the hangman figure on the canvas.

The project features a modern dark-themed graphical user interface, including a score counter, lives display, hangman drawing area, restart functionality, and interactive pop-up messages for winning and losing the game.

This project demonstrates the use of Python fundamentals such as:

- Variables and data types
- Lists and strings
- Conditional statements
- Loops
- Functions
- Event-driven programming
- GUI development with Tkinter

## Objectives

- Develop a fully functional Hangman game.
- Provide an engaging and user-friendly interface.
- Improve logical thinking and problem-solving skills.
- Demonstrate Python programming concepts through a real-world project.

## Key Features

- Random word generation
- Interactive A–Z keyboard
- Hangman drawing canvas
- Score tracking system
- Lives counter
- Restart game option
- Win/Lose pop-up notifications
- Dark gaming-themed user interface

## Technologies Used

- Python
- Tkinter (Built-in Python GUI Library)

## Conclusion

Hangman Master is a beginner-friendly Python project that combines game logic with graphical user interface development. It provides an enjoyable gaming experience while demonstrating important programming concepts and software development skills.
